The modern theory of factor pricing provides a satisfactory explanation of the problem of distribution. It is known as the demand and supply theory of distribution. According to the modem theory of factor pricing, the equilibrium factor prices can be explained by the forces of demand and supply.

Modern Theory of Distribution (An Overview)
We use factorial notation for this. Definition of n! n factorial is defined as the product of all the integers from 1 to n (the order of multiplying does not matter) . We write "n factorial" with an exclamation mark as follows: `n!` n! = (n)(n − 1)(n − 2)...(3)(2)(1) Examples. a) 5! = 5 × 4 × 3 × 2 × 1 = 120

1. Factorial Notation Theory
In mathematics, the factorial of a positive integer n, denoted by n!, is the product of all positive integers less than or equal to n: n ! = n ⋅ ⋯ ⋅ ⋯ ⋅ 3 ⋅ 2 ⋅ 1. {\displaystyle n!=n\cdot \cdot \cdot \cdot \cdots \cdot 3\cdot 2\cdot 1\,.} For example, 5 ! = 5 ⋅ 4 ⋅ 3 ⋅ 2 ⋅ 1 = 120. {\displaystyle 5!=5\cdot 4\cdot 3\cdot 2\cdot 1=120\,.} The value of 0! is 1, according to the convention for an empty product. The factorial operation is encountered in many areas of ...

The Heckscher–Ohlin model is a general equilibrium mathematical model of international trade, developed by Eli Heckscher and Bertil Ohlin at the Stockholm School of Economics. It builds on David Ricardo's theory of comparative advantage by predicting patterns of commerce and production based on the factor endowments of a trading region. The model essentially says that countries export products that use their abundant and cheap factors of production, and import products that use the ...
