Application note Heavy Fuel Oil (HFO) additive dosing unit for ship engines Fuel Oil is a liquid that remains as a residue when distillate fuels are removed from crude petroleum during refining. The impurities in the original crude are concentrated in the residue giving rise to a number of difficulties in the combustion of residual fuel oil.

The major properties of heavy fuel oil are as follows; 1. Density: Density is the relationship between mass and volume at a stated temperature, and the SI unit is Kg/m3. This gives value of 800- 1010 kg/m3 for marine heavy fuel oil. The density of HFO is limited to 991kg/m3 to facilitate efficient centrifuging.

Fuel oil is a fraction obtained from petroleum distillation, either as a distillate or a residue. In general terms, fuel oil is any liquid fuel that is burned in a furnace or boiler for the generation of heat or used in an engine for the generation of power, except oils having a flash point of approximately 42 °C and oils burned in cotton or wool-wick burners. Fuel oil is made of long hydrocarbon chains, particularly alkanes, cycloalkanes, and aromatics. The term fuel oil is also used in a ...

In the MARPOL Marine Convention of 1973, heavy fuel oil is defined either by a density of greater than 900 kg/m³ at 15°C or a kinematic viscosity of more than 180 mm²/s at 50°C. Heavy fuel oils have large percentages of heavy molecules such as long-chain hydrocarbons and aromatics with long-branched side chains. They are black in color.
