Momentum ( $p$ ): Mass times velocity. ( $\text{kg}\cdot\text{m/s}$ ) Mass ( $m$ ): A quantity that describes how much material exists, or how the material responds in a gravitational field. Mass is a measure of inertia. ( $\text{kg}$ ) Velocity ( $v$ ): Displacement divided by time ( $\text{m/s}$ ) Angular momentum ( $L$ ): A vector quantity that represents the

Momentum is a conserved quantity; the momentum of an object is never changed. The momentum of an object varies directly with the speed of the object. Two objects of different mass are moving at the same speed; the more massive object will have the greatest momentum. A less massive object can never have more momentum than a more massive object.

## Exam Questions - Momentum and impulse | ExamSolutions

The linear momentum of a particle (object) is a vector quantity equal to the product of the mass of the particle (object) and its velocity. The momentum (symbol  $\vec{p}$ ) of an object of mass  $m$  moving at velocity  $v$  is:  $\vec{p} = m\vec{v}$   
Momentum is directly proportional to both the mass and velocity of an object.

Momentum as a Vector Quantity. Momentum is a vector quantity. As discussed in an earlier unit, a vector quantity is a quantity that is fully described by both magnitude and direction. The law states that if there is no external force acting on a system, the total momentum remains a constant, which provides a powerful way to analyze interactions between systems of objects. For example, if a rolling ball on a frictionless surface collides with another ball, the total momentum before and after the collision is the same.
