The site mostly features eBooks on programming languages such as, JavaScript, C#, PHP or Ruby, guidebooks and more, and hence is known among developers or tech geeks and is especially useful for those preparing for engineering.

### Turboshaft Engine

A turboshaft engine is a form of gas turbine that is optimized to produce shaftpower rather than jet thrust. In concept, turboshaft engines are very similar to turbojets, with additional turbine expansion to extract heat energy from the exhaust and convert it into output shaft power. They are even more similar to turboprops, with only minor differences, and a single engine is often sold in both forms. Turboshaft engines are commonly used in applications that require a sustained high power output

### Turboshaft - Wikipedia

A turboshaft engine is a variant of a jet engine that has been optimised to produce shaft power to drive machinery instead of producing thrust. Turboshaft engines are most commonly used in applications that require a small, but powerful, light weight engine, inclusive of helicopters and auxiliary power units .

Fuel-Efficient Power Our T55 family of military turboshaft engines began life, as its designation indicates, in 1955. To date, more than 6,000 T55 engines have been produced, logging some 12 million hours of operation on the Boeing CH-47 Chinook and MH-47 helicopters. At its introduction, the T55 produced 1,600 shaft horsepower (SHP).

A turboprop engine bears a functional similarity to a turbofan, in that the shaft of the engine is used to drive another system. The other system is in this case a gearbox and a propeller, rather than a ducted fan. The core engine is designed much more in focus on creating torque, rather than providing thrust.
